ABSTRACT

Let $\mathcal{A}$ be a commutative unital C^* -algebra and let $\hat{\mathcal{A}}$ denote its Gelfand spectrum. We find some necessary and sufficient conditions for a nondegenerate representation of $\mathcal{A}$ to be unitarily equivalent to a multiplicative representation on a space $L^2(\hat{\mathcal{A}}, \mu)$, where μ is a positive measure on the Baire sets of $\hat{\mathcal{A}}$. We also compare these conditions with the multiplicity-free property of a representation.
